Update website feedfoodtransfer.nl

Last update March 4, 2025.

Below, a summary of features added and issues addressed on http://feedfoodtransfer.nl/, since its release on January 27 2020, is provided. Changes are given per transfer model, starting with the most recent changes.

Feature	Description		
General website			
Model documentation (14-02-2024)	Addition of page with model documentation.		
Update proclaimer (27-05-2020)	Addition of following sentence "To evaluate compliance with legal standards, the results obtained with the simulation of the transfer of the contaminant from feed to animal products should be confirmed by analytical results".		
Transfer model aflatoxin B1 - dairy cow			
Version 1.2	The option to adjust the daily milk production was removed, since the model was specifically calibrated for a daily milk production of 35L.		
Version 1.1 (02-03-2021)	 Changes were made to improve the user-friendliness of the model including: The daily milk production can now be changed A warning will be given when negative values are entered in the input fields Results for milk (aflatoxin M1) and results for muscle, kidney and milk (aflatoxin B1 and M1) can be displayed simultaneously. Graph functions of Plotly are added. The report now contains the proclaimer, the model version used, the date, all input data and the output as visible online when the report is made. The manual is updated to comply with version 1.1. 		
Version 1.0 (27-01-2020)	Release		
Transfer model dioxins (total TEQ) - dairy cow			
Version 1.2 (14-05-2024)	Changed a differential equation to avoid an increase in total TEQ concentrations in milk when the milk production increases.		
Version 1.1 (02-03-2021)	 Body fat concentrations were incorrectly calculated in version 1.0. This is corrected in version 1.1. Changes were made to improve the user-friendliness of the model including: A warning will be given when negative values are entered in the input fields. Results for milk fat and body fat can be displayed simultaneously. Graph functions of Plotly are added. The report now contains the proclaimer, the model version used, the date, all input data and the output as visible online when the report is made. The manual is updated to comply with version 1.1. 		

Version 1.0	Release		
(27-01-2020)			
Transfer model PFOS / PFOA – dairy cow			
Version 2.0	The transfer model is updated and can now also be used to calculate		
(21-03-2022)	the transfer of PFOA. The manual is updated to comply with version 2.0.		
Version 1.1 (02-03-2021)	 A warning will be given when negative values are entered in the input fields Results for a lumped compartment based on the weighed sum of liver, kidney and muscle weight are now visible and can be displayed simultaneously with the results for blood and milk. The manual is updated to comply with version 1.1. 		
Version 1.0 (01-12-2021)	Release		
Transfer model cadmium -	pig		
Version 2.0 (11-01-2023)	The transfer model is updated and a default time-dependent intake (in kg 88% dry matter per day) starting at day 28 (compound feed) or at day 66 (wet mixes) is available. The user can still use a specific feeding regime instead of this default regime.		
	 In addition changes were made to improve the user-friendliness of the model including: A warning will be given when negative values are entered in the input fields. Results for liver and kidney and the feed intake curve can be displayed simultaneously. Graph functions of Plotly are added. The report now contains the proclaimer, the model version used, the date, all input data and the output as visible online when the report is made. The manual is updated to comply with version 2.0. 		
Version 1.0 (27-01-2020)	Release		
Transfer model dioxins (total TEQ) - pig			
Version 2.0 (21-03-2022)	The transfer model is updated and a default time-dependent intake (in kg 88% dry matter per day) starting at day 28 (compound feed) or at day 66 (wet mixes) is available. The user can still use a specific feeding regime instead of this default regime. In addition changes were made to improve the user-friendliness of the model including:		
	 A warning will be given when negative values are entered in the input fields. Results for body fat and central compartment and the feed intake curve can be displayed simultaneously. Graph functions of Plotly are added. The report now contains the proclaimer, the model version used, the date, all input data and the output as visible online when the report is made. The manual is updated to comply with version 2.0. 		

(27-01-2020)Transfer model dioxins (total TEQ) – laying henVersion 1.1For parameters y, Fabs and k a set of optimal solutions can defined based on the upper and lower boundaries of allow parameter values, Parameters y, Fabs and k were set to thy solution Fabs,min; kmin = 0; ymax; Wfmin). This has basically consequences for the estimations of the transfer model.Version 1.0Release(01-12-2020)Transfer model dioxins (congener-specific) – laying henVersion 1.4The delay between contamination and egg concentration removed. This only shifts the peak of the egg concentration change. In addition, a bug was fixed where the egg concentration change. In addition, a bug was fixed where the egg concent was divided by the laying efficiency, resulting in an overes the egg concentrations.Version 1.3For parameters y, Fabs and k a set of optimal solutions can defined based on the upper and lower boundaries of allow parameter values, Parameters y, Fabs and k were set to the solution Fabs,min; kmin = 0; ymax). This has basically no cons for the estimations of the transfer model.Version 1.2The unit for the contaminant concentrations in feed in the odwnloadable xlsx.file is correctedVersion 1.1Changes were made to improve the user-friendliness of the including: • The CVS template for entering the contaminant concentrations in feed is replaced by an xls.file • A warning will be given when negative values are the input fields • The option to insert a regulatory limit for body fa	wable e boundary no was on towards n does not ntration
Version 1.1 (21-03-2022)For parameters y, F _{abs} and k a set of optimal solutions can defined based on the upper and lower boundaries of allow parameter values, Parameters y, F _{abs} and k were set to the solution Fabs,min; k _{min} = 0; y _{max} ; W _{fmin}). This has basically consequences for the estimations of the transfer model.Version 1.0 (01-12-2020)ReleaseTransfer model dioxins (congener-specific) – laying henVersion 1.4 (14-05-2024)The delay between contamination and egg concentration removed. This only shifts the peak of the egg concentratio change. In addition, a bug was fixed where the egg conce was divided by the laying efficiency, resulting in an overes the egg concentrations.Version 1.3 (21-03-2022)For parameters y, F _{abs} and k a set of optimal solutions can defined based on the upper and lower boundaries of allow parameter values, Parameters y, F _{abs} and k were set to the solution F _{abs} ,min; k _{min} = 0; y _{max}). This has basically no cons for the estimations of the transfer model.Version 1.2 (02-03-2021)The unit for the contaminant concentrations in feed in the downloadable xlsx.file is correctedVersion 1.1 	wable e boundary no was on towards n does not ntration
(21-03-2022)defined based on the upper and lower boundaries of allow parameter values, Parameters y, Fabs and k were set to the solution Fabs,min; kmin = 0; ymax; Wfmin). This has basically consequences for the estimations of the transfer model.Version 1.0 (01-12-2020)ReleaseTransfer model dioxins (congener-specific) – laying hen Version 1.4 (14-05-2024)The delay between contamination and egg concentration removed. This only shifts the peak of the egg concentratio change. In addition, a bug was fixed where the egg concentratio change. In addition, a bug was fixed where the egg concentrations.Version 1.3 (21-03-2022)For parameters y, Fabs and k a set of optimal solutions can defined based on the upper and lower boundaries of allow parameter values, Parameters y, Fabs and k a set of optimal solutions can defined based on the upper and lower boundaries of allow parameter values, Parameters y, Fabs and k were set to the solution Fabs,min; kmin = 0; ymax). This has basically no cons for the estimations of the transfer model.Version 1.2 	wable e boundary no was on towards n does not ntration
parameter values, Parameters y, Fabs and k were set to the solution Fabs,min; kmin = 0; ymax; Wfmin). This has basically consequences for the estimations of the transfer model.Version 1.0 (01-12-2020)ReleaseTransfer model dioxins (congener-specific) – laying henVersion 1.4 (14-05-2024)The delay between contamination and egg concentration removed. This only shifts the peak of the egg concentratio change. In addition, a bug was fixed where the egg conce was divided by the laying efficiency, resulting in an overes the egg concentrations.Version 1.3 (21-03-2022)For parameters y, Fabs and k a set of optimal solutions can defined based on the upper and lower boundaries of allow parameter values, Parameters y, Fabs and k a set of optimal solutions can defined based on the upper and lower boundaries of allow parameter values, Parameters y, Fabs and k were set to the solution Fabs,min; kmin = 0; ymax). This has basically no cons for the estimations of the transfer model.Version 1.2 (02-03-2021)The unit for the contaminant concentrations in feed in the 	e boundary no was on towards n does not ntration
solution Fabs,min; kmin = 0; ymax; Wfmin). This has basically consequences for the estimations of the transfer model.Version 1.0 (01-12-2020)ReleaseTransfer model dioxins (congener-specific) – laying henVersion 1.4 (14-05-2024)The delay between contamination and egg concentration removed. This only shifts the peak of the egg concentratio the end of exposure. The height of the peak concentratio change. In addition, a bug was fixed where the egg conce was divided by the laying efficiency, resulting in an overes the egg concentrations.Version 1.3 (21-03-2022)For parameters y, Fabs and k a set of optimal solutions can defined based on the upper and lower boundaries of allow parameter values, Parameters y, Fabs and k were set to the solution Fabs,min; kmin = 0; ymax). This has basically no cons for the estimations of the transfer model.Version 1.2 (02-03-2021)The unit for the contaminant concentrations in feed in the downloadable xlsx.file is correctedVersion 1.1 	no was on towards n does not ntration
consequences for the estimations of the transfer model.Version 1.0 (01-12-2020)ReleaseTransfer model dioxins (congener-specific) – laying henVersion 1.4 (14-05-2024)The delay between contamination and egg concentration removed. This only shifts the peak of the egg concentratio change. In addition, a bug was fixed where the egg conce was divided by the laying efficiency, resulting in an overes the egg concentrations.Version 1.3 (21-03-2022)For parameters y, F _{abs} and k a set of optimal solutions can defined based on the upper and lower boundaries of allow parameter values, Parameters y, F _{abs} and k were set to the solution F _{abs} ,min; k _{min} = 0; y _{max}). This has basically no cons for the estimations of the transfer model.Version 1.2 (02-03-2021)The unit for the contaminant concentrations in feed in the 	was on towards n does not ntration
Version 1.0 (01-12-2020)ReleaseTransfer model dioxins (congener-specific) – laying henVersion 1.4 (14-05-2024)The delay between contamination and egg concentration removed. This only shifts the peak of the egg concentratio change. In addition, a bug was fixed where the egg conce was divided by the laying efficiency, resulting in an overes the egg concentrations.Version 1.3 (21-03-2022)For parameters y, Fabs and k a set of optimal solutions can defined based on the upper and lower boundaries of allow parameter values, Parameters y, Fabs and k were set to the 	on towards n does not ntration
(01-12-2020)Transfer model dioxins (congener-specific) – laying henVersion 1.4The delay between contamination and egg concentration(14-05-2024)The delay between contamination and egg concentration(14-05-2024)removed. This only shifts the peak of the egg concentration(14-05-2024)removed. This only shifts the peak of the egg concentration(14-05-2024)removed. This only shifts the peak of the egg concentration(14-05-2024)removed. The height of the peak concentration(14-05-2024)removed. The height of the peak concentration(14-05-2024)removed. The only shifts the peak of the egg concentration(14-05-2024)removed. The addition, a bug was fixed where the egg concentration(14-05-2024)removed. Version 1.1Changes were made to improve the user-friendliness of the including:(01-12-2020)• The CVS template for entering the contaminant concentrations in feed is replaced by an xls.file• A warning will be given when negative values are the input fields	5
 (01-12-2020) The CVS template for entering the contaminant concentrations in feed is replaced by an xls.file A warning will be given when negative values are the input fields 	
 The CVS template for entering the contaminant concentrations in feed is replaced by an xls.file A warning will be given when negative values are the input fields 	ne model
 concentrations in feed is replaced by an xls.file A warning will be given when negative values are the input fields 	
 A warning will be given when negative values are the input fields 	
the input fields	
 The option to insert a regulatory limit for body far 	entered in
addition to egg fat is added.	t in
 The input fields for the congeners are now listed 	in separate
tabs for PCD/F and dl-PCB's.	
 Results for egg yolk fat and body fat can be displa simultaneously. 	iyed
 Results for all congeners can be displayed simultation 	noously
 Graph functions of Plotly are added. 	meousiy.
 The report now contains the proclaimer, the mod 	lel version
used, the date, all input data and the output as v	
online when the report is made.	SIDIC
The manual is updated to comply with version 1.1.	
Version 1.0 Release	
(27-01-2020)	
Transfer model non-dioxin-like polychlorinated biphenyls (ndl-PCBs)(congener-specific hen	
Version 1.1 For parameters y, F _{abs} and k a set of optimal solutions can	:) – laying
(10-09-2024) defined based on the upper and lower boundaries of allow	
parameter values, Parameters y, F _{abs} and k were set to the	only be
solution F_{abs} , min; $k_{min} = 0$; y_{max}). F_{abs} was first set to one, r	only be wable
a slight overestimation. Also, the delay between contamin	only be wable e boundary

Version 1.0 (11-01-2023)	egg concentration was removed. This only shifts the peak of the egg concentration towards the end of exposure. The height of the peak concentration does not change. Finally a bug was fixed where the egg concentration was divided by the laying efficiency, resulting in an overestimation of the egg concentrations. Release rine pesticides – laying hen	
Version 1.1 (14-05-2024)	The delay between contamination and egg concentration was removed. This only shifts the peak of the egg concentration towards the end of exposure. The height of the peak concentration does not change. In addition, a bug was fixed where the egg concentration was divided by the laying efficiency, resulting in an overestimation of the egg concentrations. Finally, changes were made with respect to the physiological values used in the model, to make them consistent with the other laying hen models. Specifically, the following changes were made: Laying efficiency: 0.91 -> 0.9 Volume of the central compartment: 1850 cm ³ -> 1840 cm ³	
	 Weight of an egg: 57.5g -> 60g 	
Version 1.0 (30-01-2023)	Release	
Transfer model dioxins (congener-specific) – free-ranging cattle grazing in floodplains		
Version 1.1 (04-03-2025)	Release
